

AI That Learns Like a Brain

New model achieves 50+ point gains in continual learning

THE DATA

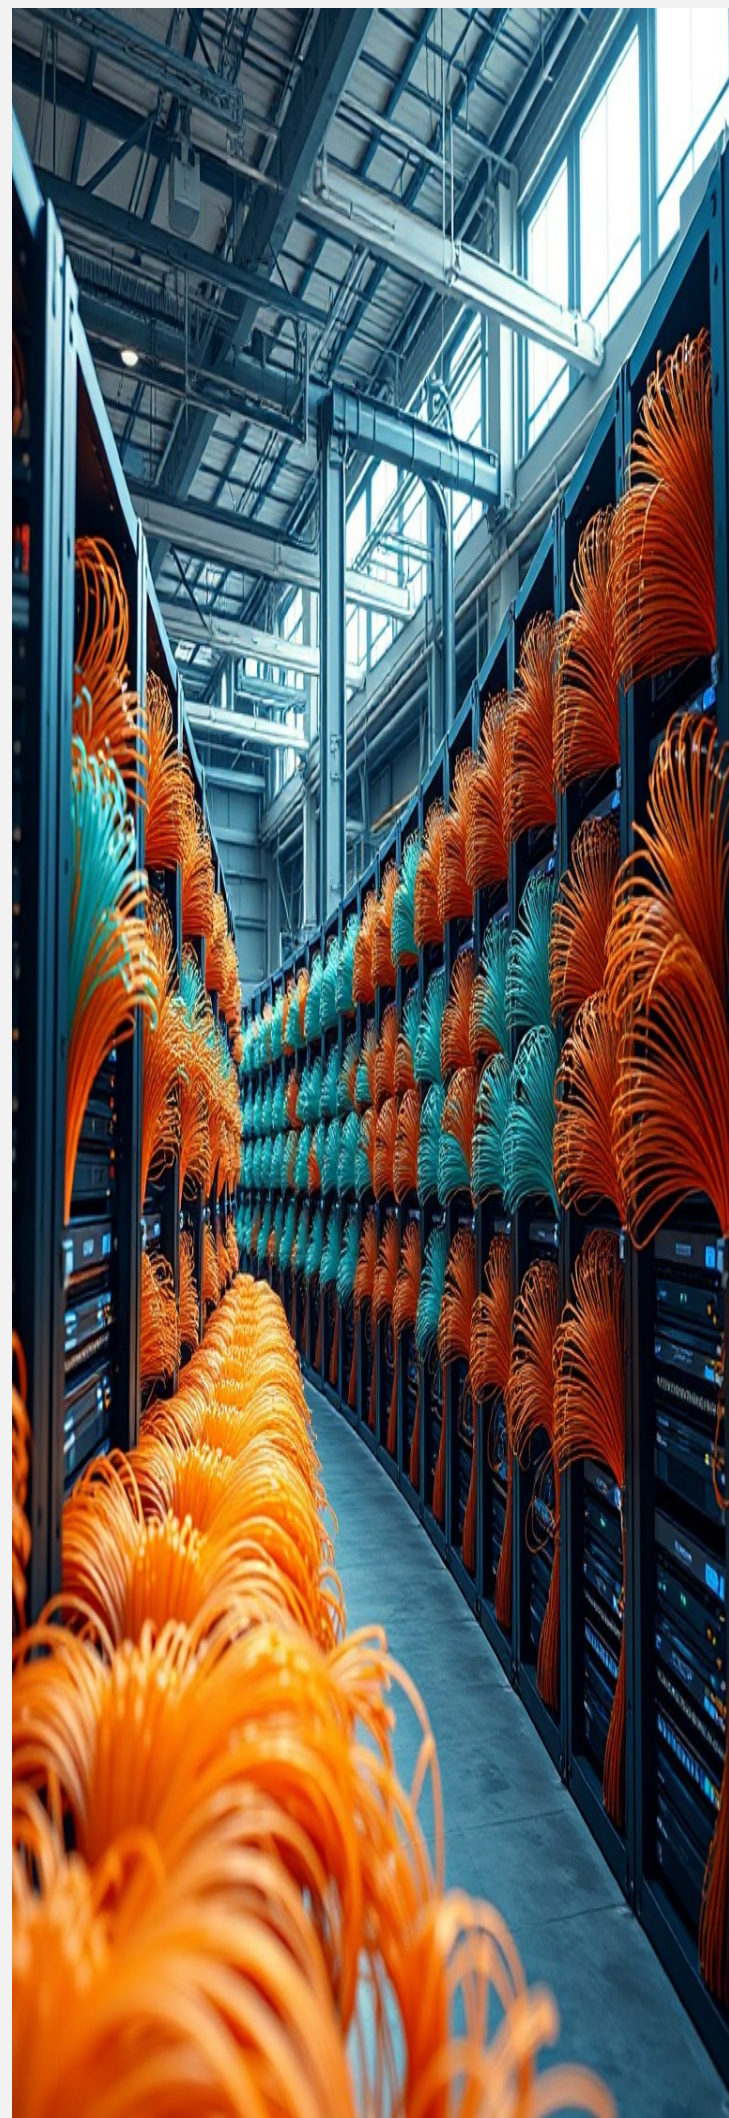

50 percentage points

Learning Gain Over Replay-Free Methods

The method outperforms existing replay-free continual learning approaches in embodied vision-language-action tasks.

This 50+ point improvement is not a marginal gain—it's a structural leap in how AI systems retain knowledge without catastrophic forgetting. Unlike traditional models that rely on data replay or rigid task separation, this brain-inspired architecture dynamically routes experience across specialized modules, enabling lifelong learning without retraining.

01

Modularity Mimics Biological Intelligence

The core innovation lies in hierarchical modularity—inspired by the *Drosophila* learning system—where neural functions are split into specialized 'experts' that integrate over time and space. This isn't just efficiency; it's a shift from static knowledge storage to dynamic, adaptive cognition. For sovereign AI builders, this means open-weight models can be designed to evolve autonomously, not just memorize.

02

No Replay, No Compromise

By eliminating the need for data replay—commonly used in continual learning but impractical for private, on-prem AI—the model enables true sovereignty. Users can train and update models locally without storing sensitive data or relying on cloud infrastructure. This is critical for teams running home labs, private RAG systems, or self-hosted LLMs who prioritize privacy and control.
