

AI Isn't Just Answering — It's Proving

The next frontier in AI is not data access, but evidence synthesis.

constructs explicit representations of scientific evidence

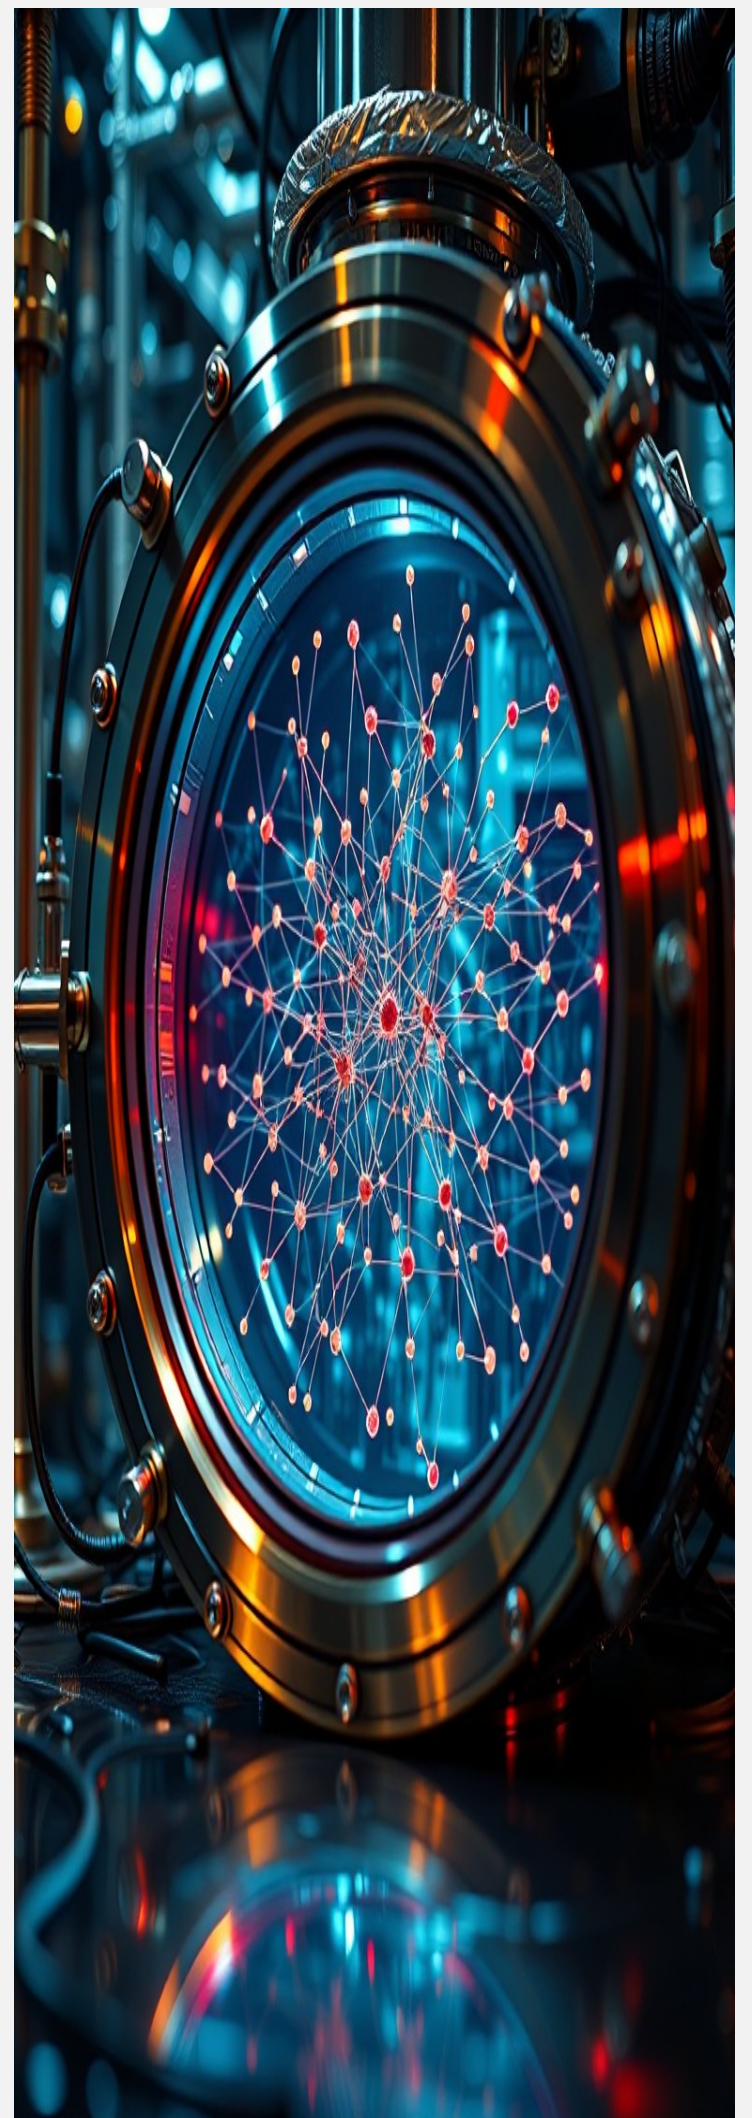

Evidence Representation Capability

DeepEvidence, a new deep research agent, moves beyond retrieval to build structured, interpretable scientific reasoning.

This marks a fundamental shift: AI is no longer just retrieving facts but constructing the logical scaffolding that supports them. By modeling evidence as explicit, traceable structures, DeepEvidence enables reproducibility and auditability in biomedical discovery — critical for high-stakes research environments. This capability signals a move from black-box inference to transparent, accountable AI reasoning.

01

Trust Requires Traceable Logic

In quantum and AI systems where decisions have real-world consequences, the ability to trace how a conclusion was derived is as important as the conclusion itself. DeepEvidence's focus on explicit evidence representation means every inference can be validated, not just assumed. This is not a feature — it's a necessity for trustworthy AI in regulated domains like drug development or autonomous systems.

02

Synthesis Over Search

The bottleneck in scientific progress is no longer data scarcity but cognitive overload. DeepEvidence's architecture reflects a new paradigm: systems must not just find information but integrate and synthesize it into coherent, falsifiable narratives. This is especially vital in quantum biology and materials discovery, where multi-scale, multi-modal data must be unified into a single, interpretable framework.
