

AI Doubles Weather Forecast Accuracy

A new machine-learning model beats climatology for the first time.

Swipe for insights →

doubled

Forecasting Accuracy

The model improved predictive power over the two-to-six-week range.

This isn't incremental progress — it's a paradigm shift. For the first time, models now outperform climatological averages, which had long been the baseline for this time frame.

01

Error Correction Becomes Intelligence

The breakthrough isn't just in prediction — it's in how the model learns from its own mistakes. Unlike traditional bias correction that pushes forecasts toward the mean, this AI system uses probabilistic bias correction (PBC) to preserve extreme event signals. It adapts over time, learning from historical forecast errors to refine future outputs — a form of emergent intelligence in climate modeling.

02

Quantum Readiness Starts Now

While not quantum in execution, this model exemplifies the kind of adaptive, high-fidelity inference systems that will underpin quantum-enhanced forecasting. The ability to correct errors in real time, with low computational overhead, mirrors the requirements for quantum error mitigation. This work shows that AI can serve as a bridge to quantum-scale predictability — even before full-scale quantum simulators exist.
