THE DATA

20 years

Audit Leadership Experience

Hilaire Nachtrab brings over two decades of experience in risk management and organizational effectiveness across higher education and the private sector.

This level of tenure in internal audit and governance is not incidental—it reflects a maturing institutional framework where AI-driven decision systems must be audited with the same rigor as financial controls. As AI models increasingly guide mission-critical operations in aerospace and commercial space, the need for auditable, traceable, and accountable systems is no longer optional.

01

Audit Is the AI Safety Layer

This is not about compliance for compliance’s sake. It’s about embedding trust into AI systems that operate beyond human oversight. The next generation of space platforms won’t just run on AI—they’ll be governed by it.

02

AI Governance Must Scale with Innovation

The future of space operations lies not in faster AI, but in auditable AI. When a satellite makes a split-second course correction, we must be able to reconstruct the logic, verify the data, and ensure accountability. That’s not a feature—it’s a requirement.
