

Can AI Safety Be Global Without Global Rules?

The Bridgetown Summit could make or break nuclear AI trust.

THE DATA

32 states

Nations endorsing AI control call

A coalition of nations, including Norway and Finland, has issued a unified call for frontier AI model governance.

This is the first large-scale multilateral initiative to demand international alignment on AI safety—particularly for systems that could one day govern nuclear operations. The fact that 32 states have backed a shared framework signals a shift from national silos to collective risk management. For nuclear energy, where failure is not an option, this is not just policy—it's a prerequisite for legitimacy.

01

Safety Requires Shared Standards

AI systems in nuclear operations cannot be trusted if their safety testing is fragmented across borders. The article highlights that only a few high-income nations have dedicated AI safety centers, and even fewer have the technical capacity to evaluate frontier models. Without a shared evaluation framework—like those proposed in the Paris Call and Norway-Finland initiative—nuclear regulators risk approving systems they cannot verify. This undermines the entire safety case for AI in reactor monitoring and digital twin systems.

02

The Global South Is Not a Test Case

Developing countries, despite being most exposed to cross-border AI risks, are underrepresented in current safety governance. The article notes that only six low-income nations have recognized incident response teams. For nuclear AI, this means that AI systems trained on unverified data or deployed without oversight could introduce cascading failures in regions with weak cyber resilience. The Bridgetown Summit must ensure that AI safety is not a privilege of the few but a shared burden—and that no nation is left unprepared when a model breaks out of containment.
